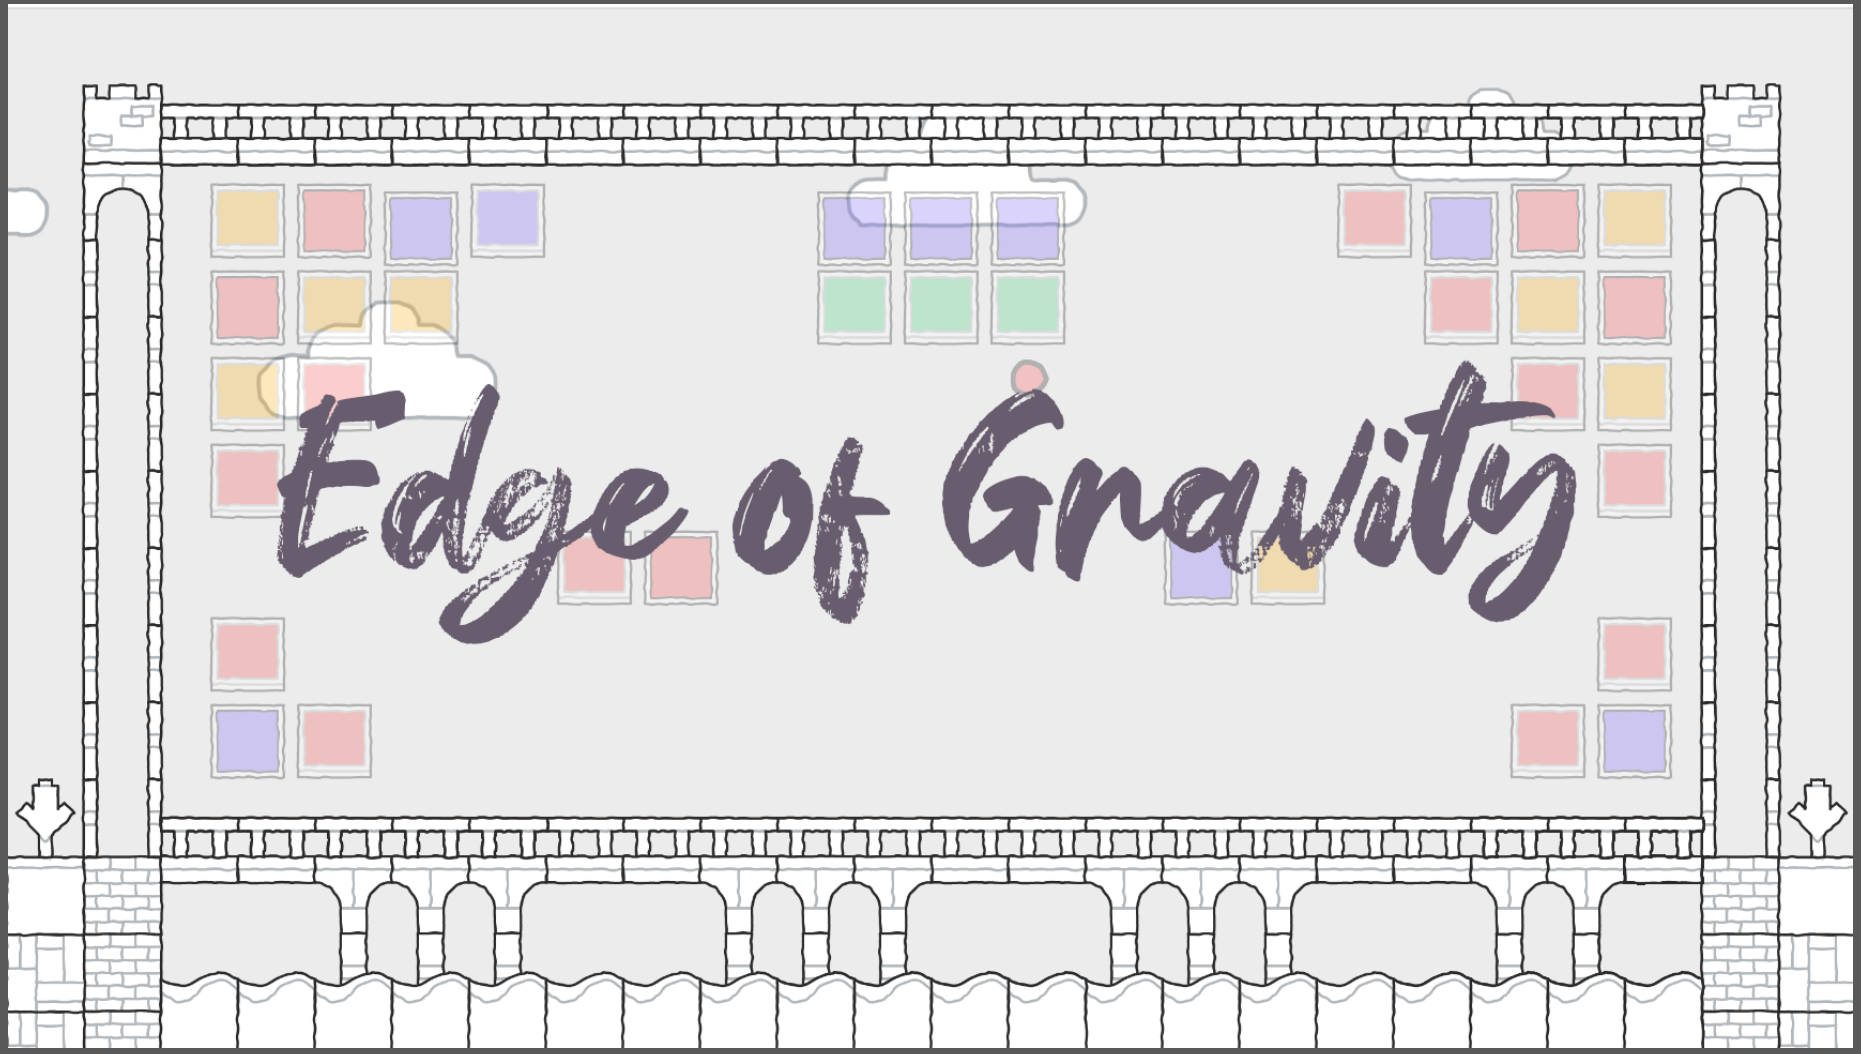
Experience the NEO experiment



Edge of Gravity

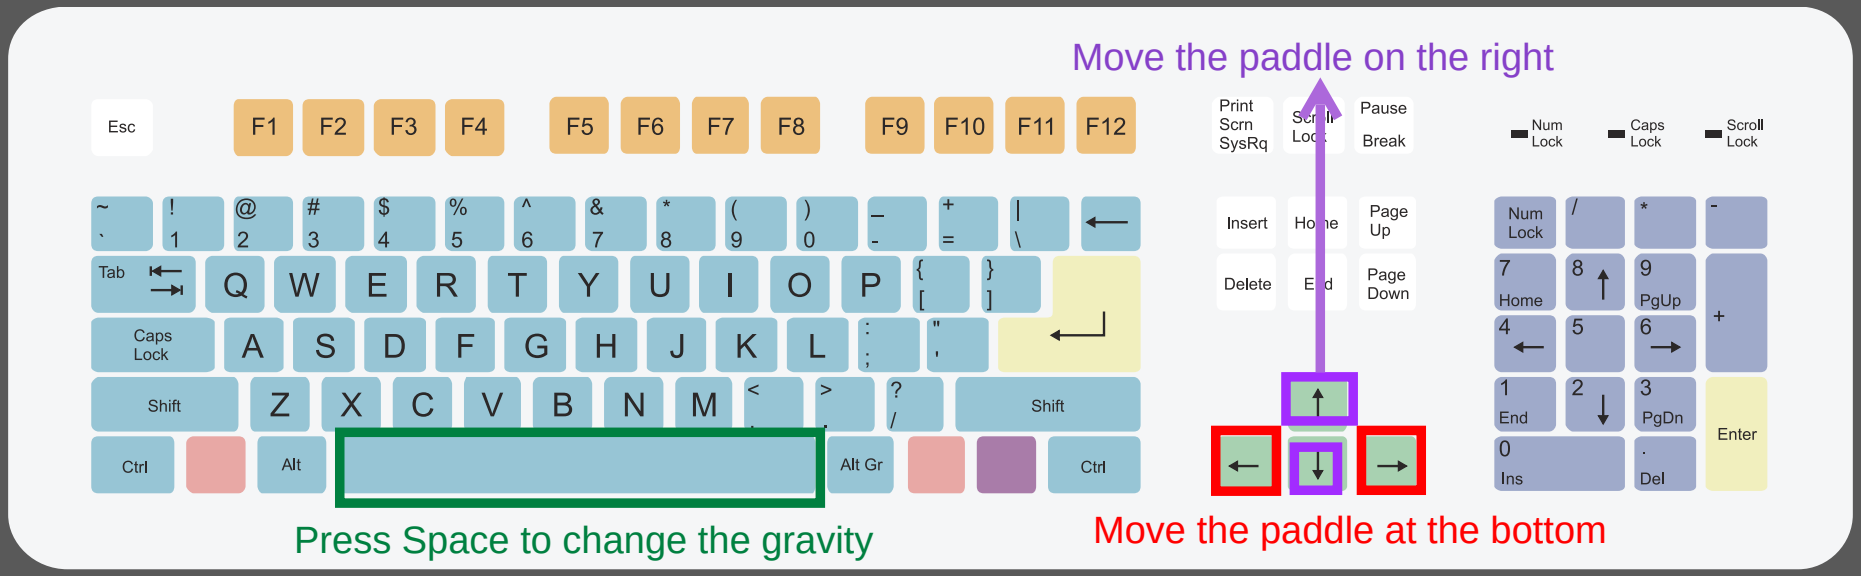
Game concept

In the year 2050, today is an ordinary day. In this highly developed technological world, just like any other day, you wake up from an abandoned castle.

As an experimental product, you have the ability to control the direction of gravity. However, this technology is not yet mature, and you are testing it by playing a brick-breaking game.

Players will find it interesting to control gravity. They may feel excited to unlock all the levels and may want to become an expert in controlling gravity.

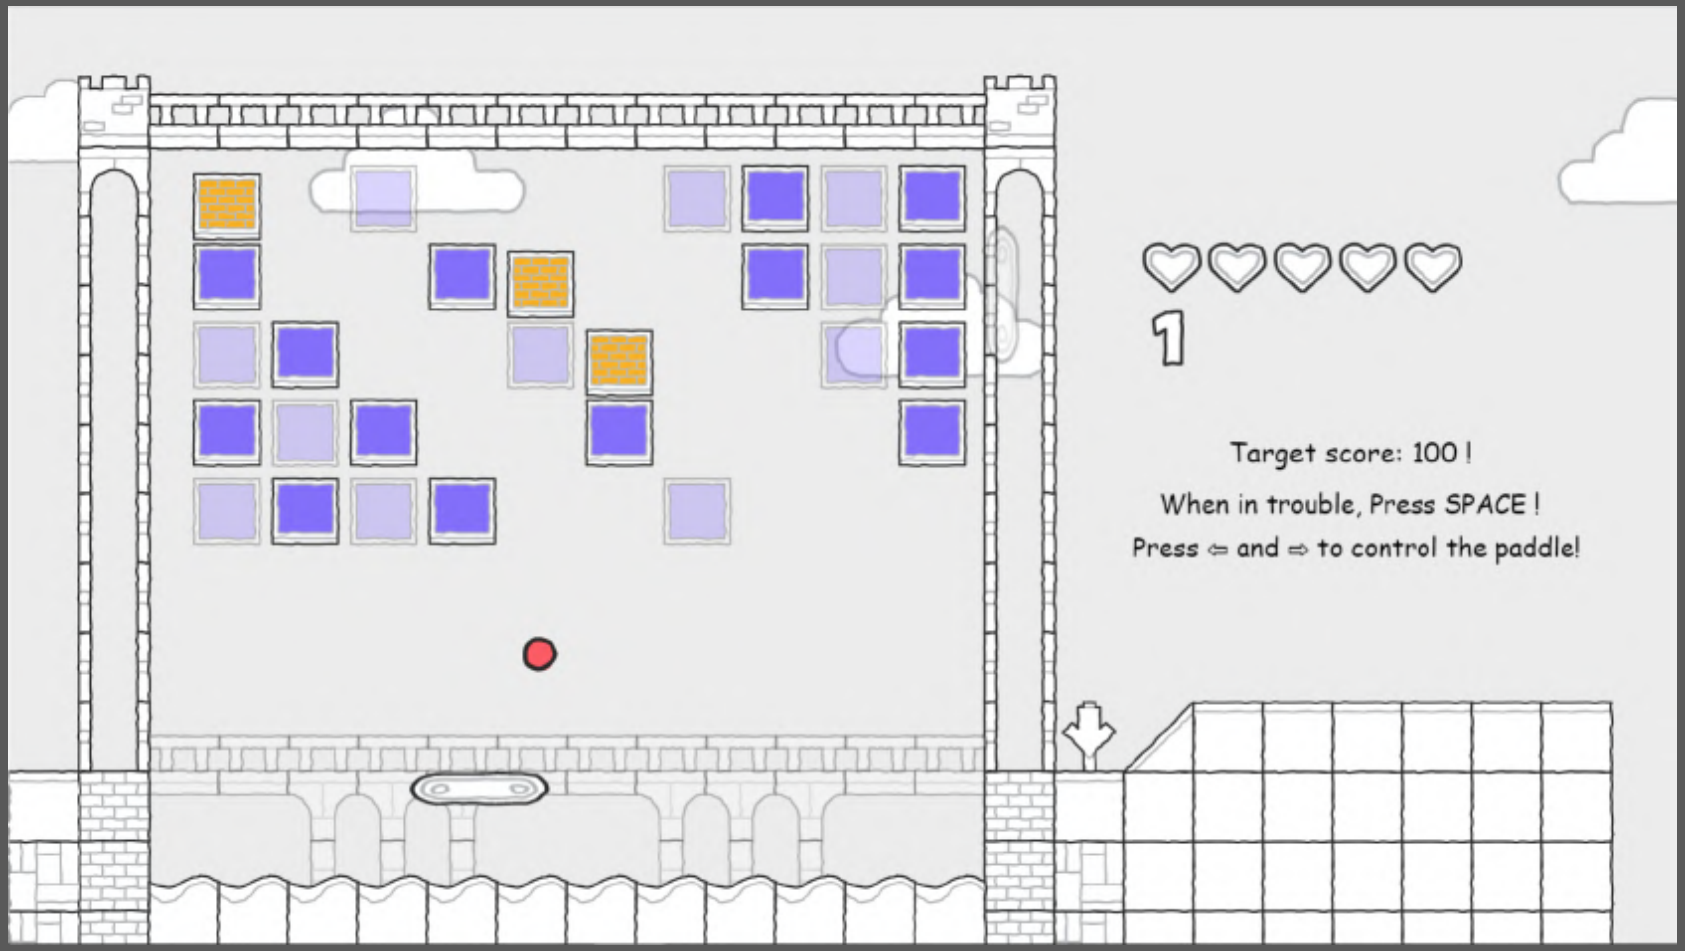
Operating instructions



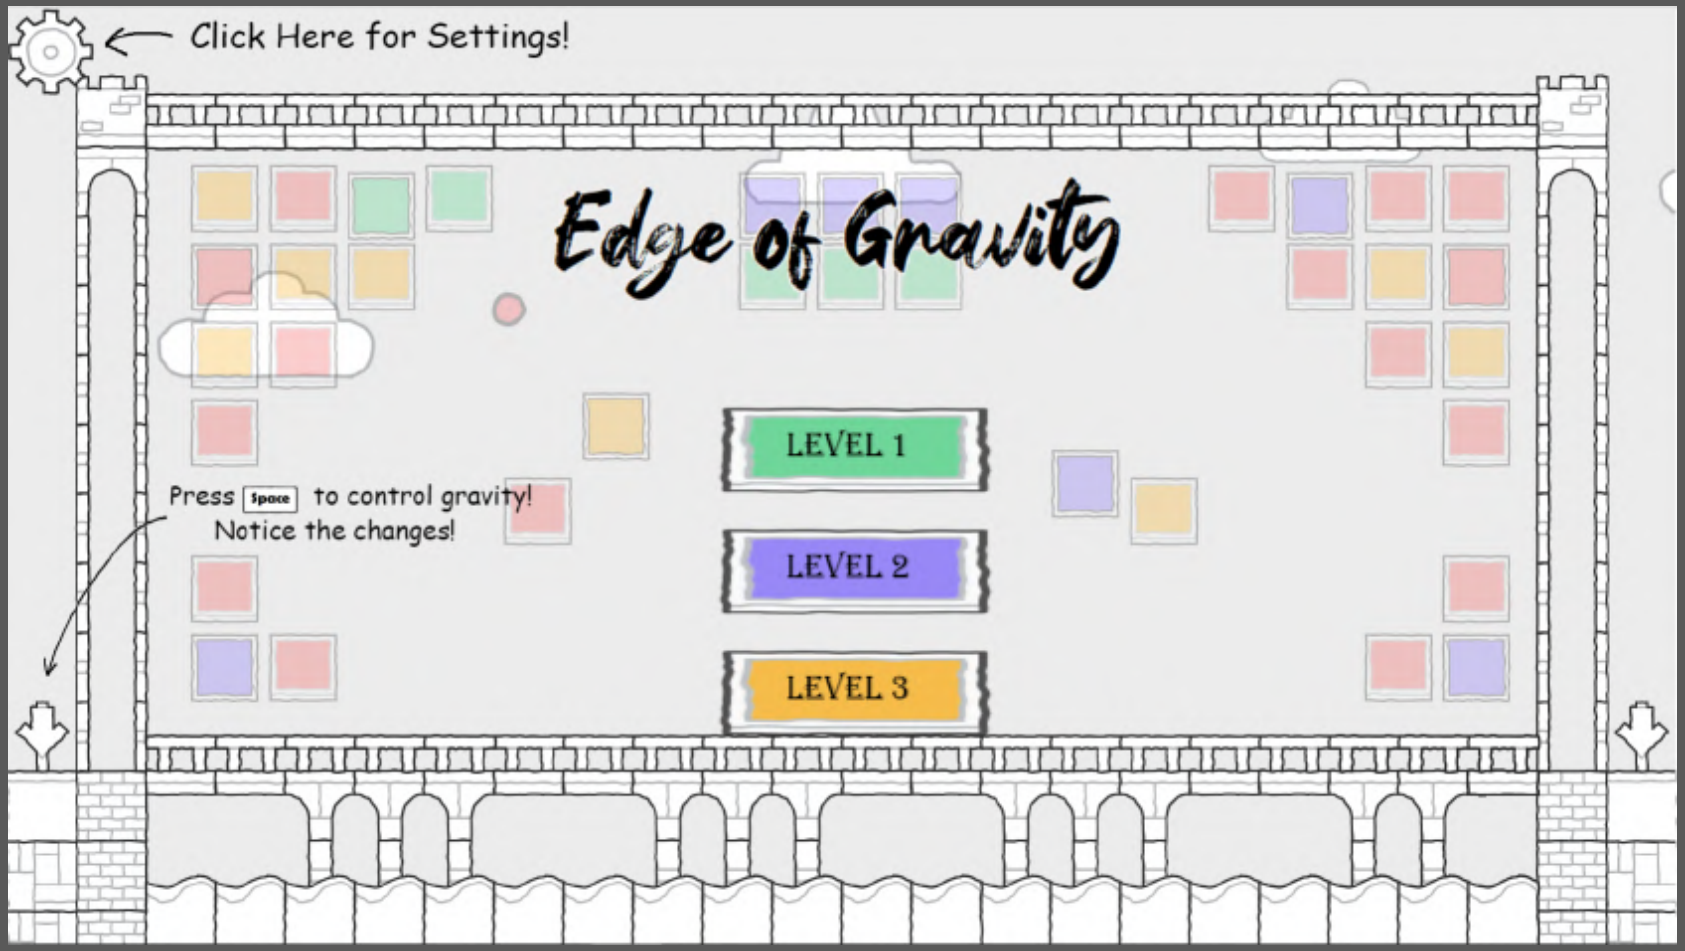
Control:

1. Space: change the direction of the gravity.
2. Left-arrow and Right-arrow: move the bottom paddle.
3. Up-arrow and Down-arrow: move the right paddle.
4. "R": refresh the ball

How to play



Move the paddle to rebound the ball and use the ball to hit bricks. Each hit leads to one score. Make full use of the skill of controlling gravity. When you achieve a certain score, you will pass this level.

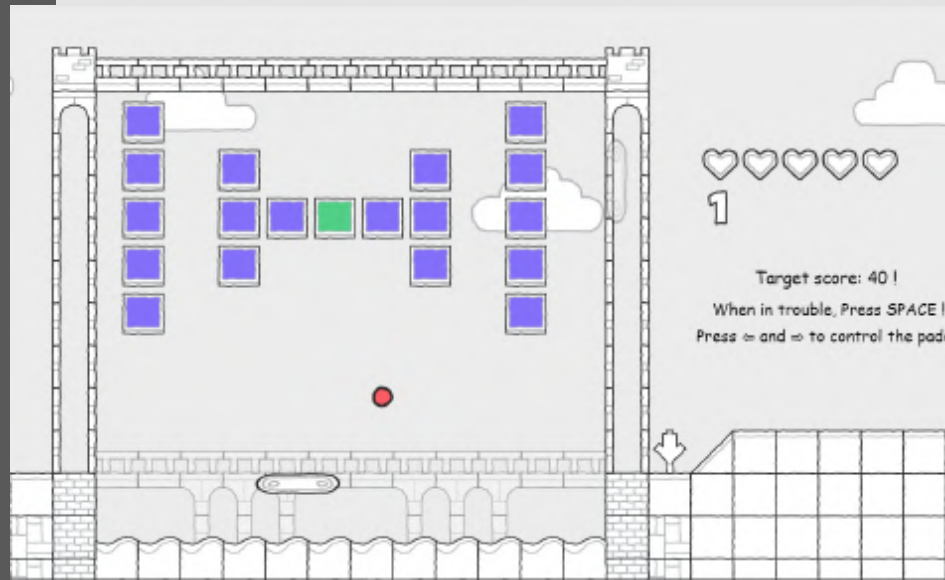


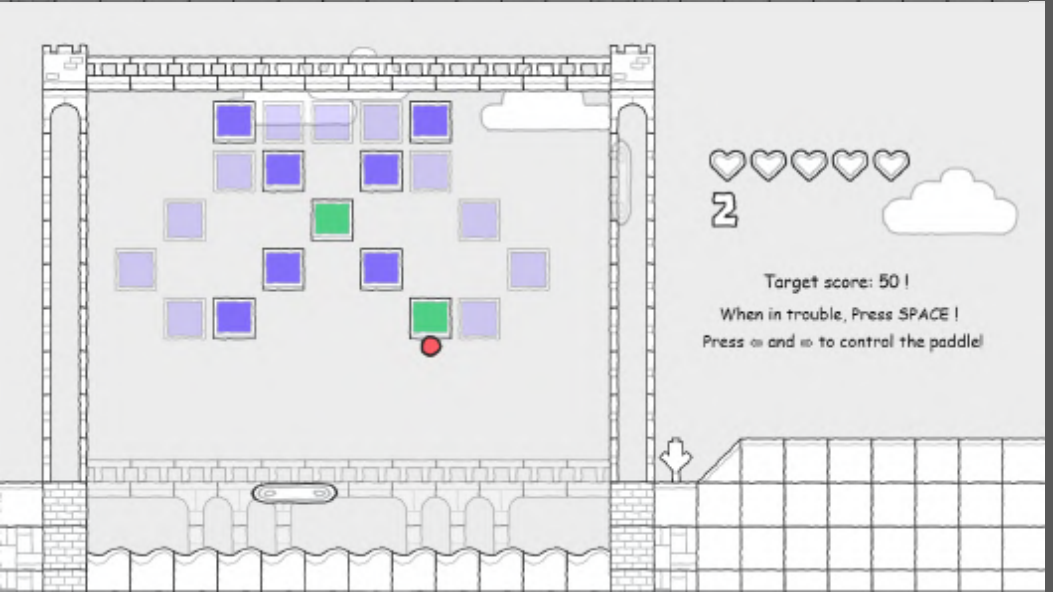
The background of the homepage is a demo mode of the game. Players can press "Enter" to see the change of gravity.

Level 1

Description of level 1

Your science enthusiast friend claims to have invented a technology that allows humans to control gravity. Although skeptical, you participated in the experiment and became one of the first people, besides her, to encounter this technology. You tested this technology by playing a brick-breaking game.



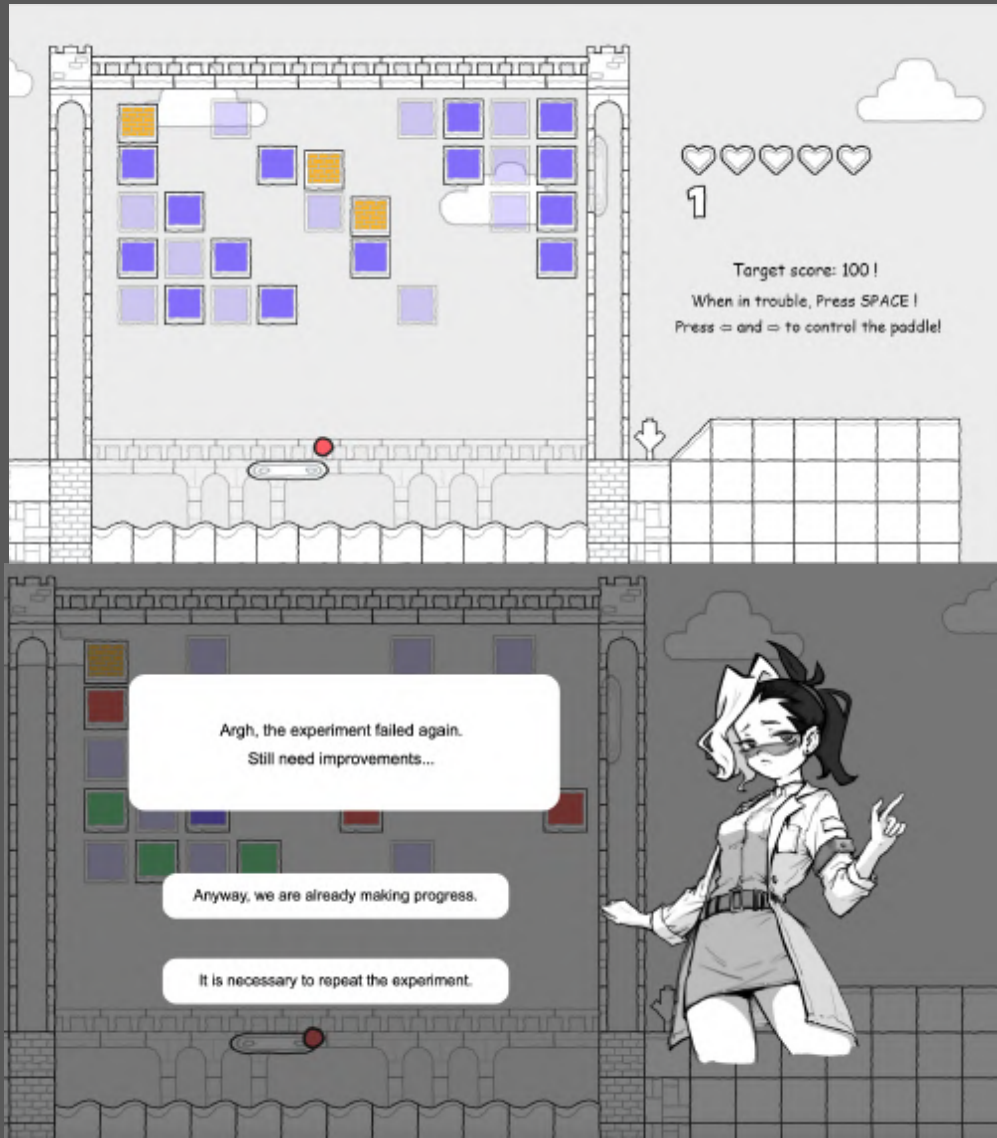


Description of level 2

The experiment was successful. With enthusiasm still high, you plan on conducting the next experiment. In the next experiment, the properties of bricks will change when the gravity is switched. The experiment becomes more complex, but you are both eager to try.

Description of level 3

Incredibly, the second experiment was also successful. Both of you were extremely excited and ready for further precision testing. This time, the test level is even more complex, and new features like unbreakable moving bricks appear. Though challenging, both of you are looking forward to it.



Creator goals

- Design a brand new gravity-based game mechanism to greatly enhance the fun and provide players with a new experience of brick-breaking games.
- A cheerful and relaxing storyline that allows players to immerse themselves in this scribble-art world.
- Lovely scribble art style that complements the light-hearted storyline.

Original elements

- Dual paddle and gravity control mechanism: Completely revolutionize traditional brick-breaking games, and design a clever and interesting level system.
- Bricks that can be hit or cannot be destroyed depending on changes in gravity: This increases the fun and strategic aspects of the game system.
- A lovely character that players can love and remember.
